WPI; 1999-009434/01. N-PSDB; AAV81744 New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.

Claim 2; Page 155-157; 193pp; English.

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify

substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene thereby

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than present sequence represents mouse PTP05. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways CC that involve the proteins, particularly cancer (e.g. leukaemia and Lymphoma), while modulators of ALK-7 (which is a type I receptor cy particularly for treating Alzheimer's, Parkinson's or Huntington's cy particularly for treating Alzheimer's, Parkinson's or Huntington's cy diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene
                                                                                                                                                                                                                                                                                                                                                             The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways
                                                                                                                                                                                                                                           New nucleic acid encoding specific protein tyrosine phosphatases - \iota for identifying specific modulators for treatment and prevention of

04-FEB-2002;

WPI; 2003-532894/50. N-PSDB; AAD57366. New human kinases and phosphatases and polynucleotides, useful for diagnosing, treating or preventing autoimmune or inflammatory disorders [e.g. AIDS, allergy or anemia), multiple sclerosis, osteoarthritis, cancer or hepatitis.

Claim 1; Page 242; 282pp; English.

The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of KPP, particularly cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, paroxysmal cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary thromobocytopaenia or cancer), developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), autoimmune, confirmantery disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), autoimmune, allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's disease, diabetes mellitus, glomerulonephritis, Goodpasture's syndrome, allergies, mashiner, shashimoto's thyroiditis, irritable bowel syndrome, cout, Grave's disease, hashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, osteoarthritis, osteoarthritis, osteoarthritis, osteoarthritis, syndrome, uveitis), or viral, syndrome, rheumatoid arthritis, slogren's syndrome, uveitis), or viral, is useful in assessing the effects of exogenous compounds on the capting the property and for creating transpant animals to model human the capting and manner of the capting animals to model human the contact of the contact of the contact of the capting and manner of the contact of the capting and manner of the contact of the contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact of the capting and contact The present sequence is human KPP protein disease.

PP polymucleotide and polypeptide are useful in the diagnosis, treatment and prevention of immune system disorders, neurological disorders, developmental disorders and cell proliferative disorders. Examples of immune system disorders include acquired immune deficiency syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gandhi AR, Griffin JA;

The present invention relates to a new human tyrosine phosphatase

Co polypeptide. The invention is useful for the preparation of a medicament

Co for modulating the activity of human tyrosine phosphatase in a disease

Such as obesity, diabetes, a central nervous system (CNS) disorder.

Chronic obstructive pulmonary disease, cardiovascular disorder or cancer.

The invention is useful for treating a human tyrosine phosphatase

dysfunction related disease, preferably the above mentioned diseases. The

Invention is useful for treating the above mentioned diseases. The

CNS disorder is selected from Parkinson's disease, and the

CR Storder is selected from Parkinson's disease, and the

Cardiovascular disorder is selected from congestive heart failure and

myocardial infaction. The modlecules of the invention are useful in

C diagnostic assays for detecting diseases and abnormalities of the presence of

mutations in the polypundleotide coding the polypeptide of the invention.

C The present amino acid sequence represents the human tyrosine phosphatase

CC

Tyrosine phosphatase gene located on chromosome 10
                                                                                                                                                                                                    New human tyrosine phosphatase polypeptide, the regulation of which is useful for treating obesity, diabetes, cardiovascular or central nervou system disorder, chronic obstructive pulmonary disease and cancer.
                                                                                                                                                                                                                                                                                               Claim 25; Fig 2; 145pp; English.

targets for screening pharmaceutical agents that inhibit the growth of tumor cells, or for diagnosing and treating cancer, inflammation or nucleic acids encoding cancer associated phosphatases, useful as 19-MAR-2003; 2003WO-CA000393 28-MAR-2002; 2002US-0368859P (KINE-) KINETEK PHARM INC. central nervous

The present invention describes an isolated cancer associated phosphatase nucleic acid. Also described: (1) a method of screening for biologically active agents that modulate a cancer associated phosphatase function; (2) a method for thibiting the growth of a cancer call; (4) methods of screening for targets of a cancer associated phosphatase, where the targets are associated with signal transduction in cancer cells; (5) a compound (C) for the treatment of a pharmaceutical carrier and (C); (7) methods for treating a pharmaceutical carrier and (C); (7) methods for treating a tumour comprising a pharmaceutical carrier and (C); (7) methods for treating a tumour and phosphatase of the present invention has cytostatic, immunosuppressive, determining patient prognosis, or as targets for screening pharmaceutical agents that inhibit the growth or metastasis of tumour cells. The present sequence represents the human cancer associated phosphatase DKFZP566K0524, which is used in the exemplification of the present such as autoimmune disease, diabetes mellitus, multiple sclerosis, rheumatoid arthritis, psoriasis, atherosclerosis, inflammation, scarring, endometriosis or angiogenesis, determining the effectiveness of drugs, antidiabetic, neuroprotective, antirheumatic, antiarthritic, antiarteriosclerotic, antiarthritic, antiarteriosclerotic, antinflammatory, vulnerary, gynaecological and antiangiogenic activities. The cancer associated phosphatases and nucleic acids encoding the proteins are useful for visualising tumours in patients or diagnosing and treating cancer, pancreas, lung, ovarian, liver or colon cancer. The polypeptides and nucleic acids may also be used for treating hyperproliferative diseases, Claim 1; SEQ ID NO 10; 63pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wang J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on gels, as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Wang J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cativity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abstrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders for generatic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AbG00010-AbG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the winy and the printed specification, but was obtained in the winy and the printed specification, but was obtained in the wing and products are applications.

The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant cerpression of KPP, particularly cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirhosis, hepatitis, paroxymal cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary cocturnal haemoglobinuria, polycythaemia vera, psoriasis, primary cocturnal haemoglobinuria retardation), neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), autoimmune/cocturnal contrological disorders (e.g. Alzheimer) autoimmune thyroiditis, contact dermatitis, contact dermatitis, contact dermatitis, contact dermatitis, contact dermatitis, contact dermatitis, protocoan corposations, pareterial general, in parasitic, protocoan or helminthic infections. The KPP corporation of nucleic acids and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human corporation of parasitis sequence is human KPP protein 55555555555555555555555555%&

```
The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The polypeptide of the invention demonstrates cardiovascular, antiarteriosclerotic, Mypotensive, vasotropic, antianflammatory, antianginal, anti-HIV, antiallergic, antidiabetic, nephrotropic, antigout, gastrointestinal, neuroprotective, osteopathic, antiarthritic, uropathic, ophthalmological, antiarthritic, uropathic, ophthalmological, antipsoriatic, antiaparkinsonian, nootropic, antionvalsant, hepatotropic, antipsoriatic, antiaparkinsonian, nootropic, antipaemic, antiparasitic, antipsoriatic, antibacterial, virucide, protrozoacide and fungicide activities. The mithacterial, virucide, protrozoacide and fungicide activities. The kinase and phosphatase (KPP) polymucleotides, polypeptides, agonists and antagonists may be useful for diagnosing, treating or preventing contrological disorders and viral, hacterial, fungal, parasitic, proliferative disorders and viral, bacterial, fungal, parasitic, proliferative disorders and viral, bacterial, fungal, parasitic, invention may be useful for creating transgenic animals to model human disease and during gene therapy, the current sequence is that of a human control of the invention.
                                                                                                                                                                 , Richardson TW, Marquis JP, Swarnakar A, Tang YT;

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then complex betroforming a bait protein selection to isolate prey proteins encoded by performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins. Also included are a combinant host cell expressing at least one of the interacting recombinant host cell expressing at least one of the interacting collypeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a sequence siven in the specification (including its fragment or variant), a vector comprising the Vector, a protein chip comprising the polypeptides and a recombinant host cell for comprising the vector, a protein chip comprising the polypeptides, polypucleotides and compounds are useful for record comprising the vector, a protein chip comprising the polypucleotides and compounds are useful for The polypucleotides and compounds are useful for gartening or treating metabolic disorders such as obesity or diabetes. The polypucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interaction, thus (RTM) for screening drugs that modulate the protein interaction, thus complex in the invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                        Human; prey; adipocyte, SID; selected interacting domain; anorectic; antidiabetic; protein-protein interaction; diabetes; yeast 2-hybrid assay; metabolic disorder; obesity.
                                            Human adipocyte Selected Interacting domain, SID, #319.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 6; Page 208-209; 382pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes human protein kinase/protein phosphatases. It is expected that the protein kinase/protein phosphatase gene participates in signal transduction in cells. The protein kinase/protein phosphatase polypeptides and polynucleotides are useful for developing diagnostics and treatment agents for human and animal diseases. The protein kinase/protein phosphatase polypeptides are useful as target molecules in designing novel drugs. The protein kinase/protein phosphatase polyputuleotides are useful as a source of probes and primers, which may be used to isolate homologous sequences. The present sequence represents a human protein, which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes human protein kinase/protein phosphatases. The polypeptides are expected to participate in signal transduction in cells. The kinase phosphatases are connected with intracellular signalling pathways. Antisense oligonucleotides and compounds identified by screening (agonists or antagonists) can be used to treat human or animal disorders associated with the expression or function of the protein. In addition, the polypeptides may be used as target molecules fir drug development. The present sequence represents a polypeptide, used in the course of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
-!- SIMILARITY: Contains 1 FERM domain.
-!- SIMILARITY: Contains 5 PDZ/DHR domains.
